BIBBOS v6.3

What's New

v6.0 → v6.3 · The Depth Pass

Port of Spain, Trinidad and Tobago · March 2026

The v6.0 vessel was architecturally complete.
v6.1 through v6.3 made it precise, accurate, instructive, and solid.

v6.1 Caribbean Jurisdiction Depth

Payroll moved from a single-jurisdiction model to six fully accurate Caribbean statutory engines, each researched to its current statutory reality and operating simultaneously under one roof.

Territory	Currency	VAT / Tax	Payroll Deductions
TT Trinidad & Tobago	TT$	12.5% VAT	PAYE annualisation · NIS split · Health Surcharge
BB Barbados	BDS$	17.5% VAT	NIS · PAYE · HS = 0 (2024 waiver — present & correct)
GY Guyana	G$	14% VAT	NIS · PAYE · scaled rates
JM Jamaica	J$	15% GCT	NIS · Income Tax · NHT · Education Tax (dedicated lines)
LC Saint Lucia	XCD	12.5% VAT	NIC · PAYE
SR Suriname	SRD	10% OB	SVB · LB · configurable rates

When a vessel is commissioned in a given territory, the payroll engine inherits that jurisdiction's statutory rules automatically. Switching jurisdiction via the company profile updates the deduction logic across the entire HR module.

v6.2 Vessel-to-Vessel Invoice Exchange

The vessel stopped being a closed island and became capable of sovereign commerce without a server. Three exchange channels were implemented under a unified V2V protocol.

- **File channel —** export an encrypted JSON invoice bundle, send via WhatsApp or email, the receiving vessel imports and creates the transaction with all line items intact
- **QR channel —** generate a QR from any live invoice; the receiving vessel scans it from the camera and imports in seconds
- **LAN channel —** vessels on the same local network discover each other and exchange invoices peer-to-peer — no internet required

Every imported invoice carries the sender's Vessel Lineage DNA intact. The receiving vessel's vendor record is automatically created or matched, preserving the full ancestry chain across the transaction.

v6.3 The Normalisation and UX Depth Pass

v6.3 is the longest and most granular evolution phase. Six distinct categories addressed simultaneously.

Stock History Foundation

Every stock mutation — initial entry, PO receipt, manual adjustment, invoice dispatch — now appends a dated entry to product.stockHistory. This is the data foundation for v6.4 EEMD-LASSO-LSTM on-device forecasting. Every product carries its complete movement history forward from commissioning.

Import Completeness

importVessel was only restoring ten data keys. Twelve additional modules were silently lost on import — employees, payrollRuns, timesheets, punches, deliveries, quotes, credits, campaigns, touchpoints, jobLogs, encounters, recurring. A vessel with a full HR history would return empty. All twelve now restored with smart accounting branch: if accounts exist, restore and rebuild; if empty, initialise fresh.

Mobile — Equal to Desktop

v6.3 is the first evolution where mobile is genuinely solid and equal to desktop. Every layout issue was identified and resolved:

- Interface Language, icon picker, currency and tax rate grids: all converted to auto-fill with minmax — wrap naturally on any screen width
- overflow: hidden on .tbl changed to overflow: visible — this was silently clipping action buttons on all list screens when columns collapsed on mobile
- Row action button container: width: 100% on mobile so buttons never clip
- Slide presentation navigation: restructured to two rows — dots centred top, Prev/Next centred below with 110px touch targets (was hidden behind OS UI on portrait mobile)
- Global overflow guard added: .exp-body * { max-width: 100%; box-sizing: border-box }

Commissioning Wizard

Field retention: all entries retained on back-navigation. Name persisted on every keystroke. Structure, location, and industry selections restored via class injection on re-render.

Structure transfer fix: the wizard stored 'sole' and 'corp' while the profile dropdown expected 'sole_proprietorship' and 'corporation'. The dropdown always showed blank after commissioning. Normalised at source across all five languages.

Forms That Teach

Every blank input across the four main entry screens now carries a contextual placeholder that teaches by showing rather than labelling:

- Customer Name: e.g. Castries Trading Co · Hotel Jalousie · Maria Joseph
- Product Cost: "What you pay — used for COGS & margin"
- Reorder Point: "Alert when stock falls to this level — e.g. 10"
- Vendor Notes: e.g. Minimum order EC$500 · Delivers Wed/Fri · 30-day credit

Notes fields added to Customer, Vendor, Invoice, and Purchase Order — all wired into save, edit, restore, PDF, and preview.

Additional Fixes

- **Advanced Reports inline toggle —** results open below the card with smooth scroll; clicking again collapses. No more scrolling to the bottom of the page.

- **Accounting panel render fix —** rAccountingTab() rebuilt to use stable DOM instead of innerHTML surgery that was destroying tab navigation.
- **Dataset normalisation —** test dataset rebuilt from zero; no pre-baked JEs causing double-posting on status changes.
- **Scroll-to-top —** every screen navigation and wizard step now starts at the top.
- **Knowledge slide audit —** all stale content updated: 6-jurisdiction tax table, live features marked live, cross-references corrected, contribution model aligned with TT gift tiers, 'End of Knowledge Module' footer moved to actual last slide.

---

v6.0 → v6.3 at a Glance

Metric	v6.0	v6.3
File size	660 KB	**719 KB**
Payroll jurisdictions	1 (TT only)	**6 (TT, BB, GY, JM, LC, SR)**
V2V exchange channels	None	**3 — file, QR, LAN**
Stock history	None	**Full dated mutation log on every product**
Mobile usability	Partial	**Equal to desktop — all grids responsive**
Wizard back-nav	Resets	**Full retention — name, structure, location, industry**
Form placeholders	None	**All entry screens — instructive by example**
Notes fields	None	**Customer · Vendor · Invoice · PO — all wired**
Import completeness	10 keys	**22 keys — all modules restored**
Knowledge slides	65 (some stale)	**65 (all current — jurisdictions, live features, correct refs)**

What Comes Next: v6.4

Target: TF.js EEMD-LASSO-LSTM forecasting running entirely inside the vessel. The v6.3 stock history layer is the training data. No API call. No cloud. No data leaving the device. The vessel learns from its own history and projects demand, cashflow, and reorder points forward — sovereign, local, continuously improving.

P2P vessel mesh — vessels on the same LAN synchronising ledger state, inventory, and HR data without a server. Conflict resolution architecture under design.

The vessel is complete. The knowledge is embedded. The sovereignty is yours.

🌱 Sovereignty multiplies. Distribute freely.
